<b>Cornell Notes</b>	<b>Topic:</b>	Course: BSc Computer Science
	<b>Limits and differentiation continued</b>	Class: Computational Mathematics[Lecture]
		Date: July 23, 2020
<b>Essential Question:</b>		
What are limits and derivatives and how do they relate to the notion of continuity of a function?		
<b>Questions/Cues:</b>		
<ul style="list-style-type: none"><li>• What are some properties of the derivative?</li><li>• What is L'Hopital Rule?</li><li>• How does the derivative of a function relate to its minima and maxima?</li><li>• What are inflection points?</li></ul>		
<b>Notes</b>		

Properties:

1) derivative of sum of two functions

Let  $f(x)=g(x)+h(x)$

$$f'(x)=g'(x)+h'(x)$$

$$f'(x)=\lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x)-f(x)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{g(x+\Delta x)+h(x+\Delta x)-g(x)-h(x)}{\Delta x}$$

$$= \lim_{\Delta x \rightarrow 0} \frac{g(x+\Delta x)-g(x)}{\Delta x} + \frac{h(x+\Delta x)-h(x)}{\Delta x} = g'(x)+h'(x)$$

2)  $n^{\text{th}}$  derivative

$$f''(x)=\lim_{\Delta x \rightarrow 0} \frac{f'(x+\Delta x)-f'(x)}{\Delta x} \rightarrow f^{(n)}(x)=\lim_{\Delta x \rightarrow 0} \frac{f^{(n-1)}(x+\Delta x)-f^{(n-1)}(x)}{\Delta x}$$

Derivative of product of two functions:

$$f(x)=g(x)h(x)$$

$$f'(x)=\lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x)-f(x)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{g(x+\Delta x)h(x+\Delta x)-g(x)h(x)}{\Delta x}$$

$$= \lim_{\Delta x \rightarrow 0} \frac{g(x+\Delta x)h(x+\Delta x) - \overbrace{g(x)h(x+\Delta x) + g(x)h(x+\Delta x)}^{=0} - g(x)h(x)}{\Delta x}$$

$$= \lim_{\Delta x \rightarrow 0} h(x+\Delta x) \frac{g(x+\Delta x)-g(x)}{\Delta x} + \lim_{\Delta x \rightarrow 0} \frac{g(x)h(x+\Delta x)-g(x)h(x)}{\Delta x}$$

$$= h(x)g'(x) + \lim_{\Delta x \rightarrow 0} g(x) \frac{h(x+\Delta x)-h(x)}{\Delta x}$$

$$= h(x)g'(x) + g(x)h'(x)$$

# Derivative from first principles

Example:  $y=f(x)=x^2$

$$f'(x)=\lim_{\Delta x \rightarrow 0} \frac{f(x+\Delta x)-f(x)}{\Delta x}$$

Let  $\Delta x=h$

$$\begin{aligned}\lim_{h \rightarrow 0} \frac{(x+h)^2 - (x)^2}{h} &= \lim_{h \rightarrow 0} \frac{(x^2 + 2xh + h^2) - x^2}{h} \\ &= \lim_{h \rightarrow 0} \frac{(2xh + h^2)}{h} = \lim_{h \rightarrow 0} (2x + h) = 2x\end{aligned}$$

$$f'(x)=2x$$

Derivative of ratio of two functions:

$$f(x)=g(x)/h(x)$$

$$f'(x) = \frac{g'(x)h(x) - g(x)h'(x)}{h^2(x)}$$

Example:  $f(x)=x^2/(2x+1)=g(x)/h(x)$

$$\begin{aligned}g(x)&=x^2 & \rightarrow & g'(x)=2x \\ h(x)&=(2x+1) & \rightarrow & h'(x)=2\end{aligned}$$

$$f'(x) = \frac{2x(2x+1) - x^2 \cdot 2}{(2x+1)^2} = \frac{4x^2 + 2x - 2x^2}{(2x+1)^2} = \frac{2x(x+1)}{(2x+1)^2}$$

## Derivative of composed function:

Composed function: two functions  $g$  and  $h$  applied in succession

Example:

$$h(x) \quad x \rightarrow \log(x)$$

$$g(x): x \rightarrow \sin(x)$$

$$\text{Composed functions} \rightarrow g(h(x)) = \sin(\log(x)) \quad h(g(x)) = \log(\sin(x))$$

$$f(x) = g(h(x)) \rightarrow f'(x) = g'(h(x))h'(x)$$

$$\text{Example: } f(x) = e^{x^2}$$

$$h(x) = x^2 \rightarrow h'(x) = 2x$$

$$g(x) = e^x \rightarrow g'(x) = e^x$$

In  $g'(h(x))$  need to replace  $h(x)$  in place of  $x$  in  $g'(x)$

$$\rightarrow g'(h(x)) = e^{h(x)} = e^{x^2}$$

$$\rightarrow f'(x) = e^{x^2} h'(x) = 2xe^{x^2}$$

$$1) f(x) = g(x) + h(x) \rightarrow f'(x) = g'(x) + h'(x)$$

$$g(x) = x^2 \quad h(x) = e^x$$

$$g'(x) = 2x$$

$$f(x) = x^2 + e^x$$

$$h'(x) = e^x$$

$$f'(x) = 2x + e^x$$

$$2) f(x) = h(x)g(x)$$

$$f'(x) = h'(x)g(x) + h(x)g'(x)$$

$$f(x) = \underbrace{(x)}_{h(x)} \underbrace{(\sin x + 1)}_{g(x)} \quad \begin{cases} h'(x) = 1 \\ g'(x) = \cos x \end{cases}$$

$$f'(x) = 1 \cdot (\sin x + 1) + x \cdot \cos x =$$

$$= \sin x + 1 + x \cos x$$

$$f(x) = \frac{g(x)}{h(x)} \rightarrow f'(x) = \frac{g'(x)h(x) - g(x)h'(x)}{(h(x))^2}$$

$$f(x) = \frac{\cos x}{x^2 + 3}$$

$$\begin{aligned} g(x) &= \cos x \rightarrow g'(x) = -\sin x \\ h(x) &= x^2 + 3 \rightarrow h'(x) = 2x \end{aligned}$$

$$f'(x) = \frac{-\sin x (x^2 + 3) - \cos x (2x)}{(x^2 + 3)^2} =$$

$$= -\frac{\sin x}{x^2 + 3} - \frac{2x \cos x}{(x^2 + 3)^2}$$

$$f(x) = g(h(x)) \rightarrow f'(x) = g'(h(x)) h'(x)$$

$$f(x) = \cos(\ln x)$$

$$g(x) = \cos x$$

$$h(x) = \ln x$$

$$g'(x) = -\sin(x)$$

$$h'(x) = \frac{1}{x}$$

$$f'(x) = -\frac{\sin(\ln x)}{x}$$

$$f(x) \quad f'(x)$$

$$x^2 \quad 2x^{2-1}$$

$$e^{ax} \quad a e^{ax}$$

$$\log(x) \quad \frac{1}{x}$$

$$\sin(x) \quad \cos(x)$$

$$\cos(x) \quad -\sin(x)$$

$$\tan(x) \quad \frac{d\left(\frac{\sin(x)}{\cos(x)}\right)}{dx} = \frac{\cos^2 x + \sin^2 x}{\cos^2 x} = \frac{1}{\cos^2 x}$$

L'Hopital's rule

$$\lim_{x \rightarrow x_0} \left( \frac{f(x)}{g(x)} \right) \quad \text{if} \quad \lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} g(x) = \begin{cases} 0 \\ \pm \infty \end{cases}$$

$$g'(x) \neq 0 \quad x \in I \setminus \{x_0\}$$

$$\Rightarrow \lim_{x \rightarrow x_0} \frac{f(x)}{g(x)} = \lim_{x \rightarrow x_0} \frac{f'(x)}{g'(x)}$$

$$1) \lim_{x \rightarrow 0} \frac{\sin x}{x} = \lim_{x \rightarrow 0} \frac{\cos x}{1} = 1$$

$$2) \lim_{x \rightarrow 0} \frac{e^x - 1}{x} = \lim_{x \rightarrow 0} \frac{e^x}{1} = 1$$

$$3) \lim_{x \rightarrow 0} \frac{\ln(1+x)}{x} = \lim_{x \rightarrow 0} \frac{\frac{1}{1+x}}{1} = 1$$

$$4) \lim_{x \rightarrow 0} \frac{\cos x - 1}{x^2} = \lim_{x \rightarrow 0} \frac{-\sin x}{2x} = -\frac{1}{2} \left( \lim_{x \rightarrow 0} \frac{\sin x}{x} \right) = -\frac{1}{2}$$

$$\lim_{x \rightarrow 0} \frac{e^x - 1}{x^2 + \sin x} = \lim_{x \rightarrow 0} \frac{e^x}{2x + \cos x} = \frac{1}{1} = 1$$

$$\lim_{x \rightarrow 0} x^x = \lim_{x \rightarrow 0} e^{\log(x^x)} \quad \left| \begin{array}{l} x = e^{\log(x^2)} \\ x = e^{\log(x^2)} \end{array} \right|$$

$$= \lim_{x \rightarrow 0} e^{x \log x} \quad \lim_{x \rightarrow 0} e^{f(x)} = e^{\lim_{x \rightarrow 0} f(x)}$$

$$\lim_{x \rightarrow 0} x \log x = \lim_{x \rightarrow 0} \frac{\log x}{\frac{1}{x}} =$$

$$= \lim_{x \rightarrow 0} \frac{\frac{1}{x}}{-\frac{1}{x^2}} = \lim_{x \rightarrow 0} -x^2 \cdot \frac{1}{x} = -x \rightarrow 0$$

$$\lim_{x \rightarrow 0} x^x = 1$$

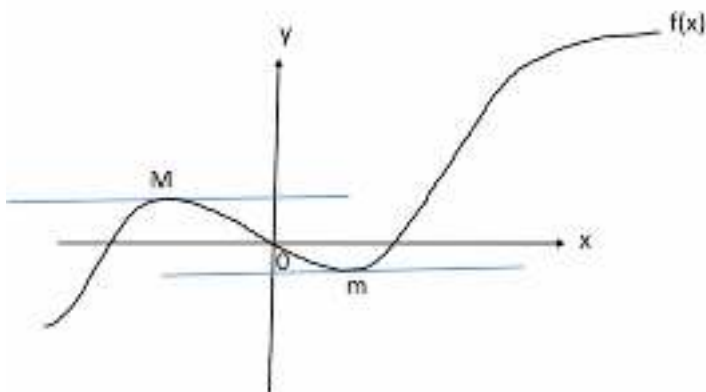

$$\lim_{n \rightarrow \infty} \frac{n^3}{e^n} \rightarrow \frac{x^3}{e^x}$$

$$\lim_{x \rightarrow \infty} \frac{x^3}{e^x} = \lim_{x \rightarrow \infty} \frac{3x^2}{e^x} =$$

$$= \lim_{x \rightarrow \infty} \frac{6x}{e^x} = \lim_{x \rightarrow \infty} \frac{6}{e^x} = 0$$

$$\lim_{n \rightarrow \infty} \frac{n^3}{e^n} = 0$$

## Maxima and minima of function $f(x)$

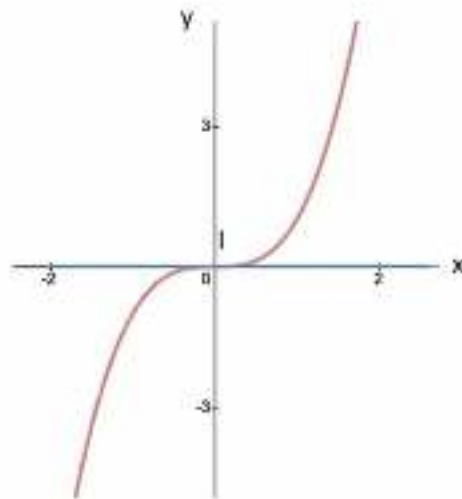

The slope of tangent line in M and m is zero (line is horizontal  $\rightarrow$  slope =  $\tan(0) = 0$ )

$\rightarrow f'(x) = 0$  in points of local Max and min

- o Because the derivative alone equalling zero not sufficient enough to determine the minima and maxima of the function

# Inflection points

$$y=f(x)=x^3 \quad (d(x^n)/dx \rightarrow nx^{n-1})$$

$$f'(x)=3x^2$$

$$f'(x)=0 \quad 3x^2=0 \rightarrow x=0$$

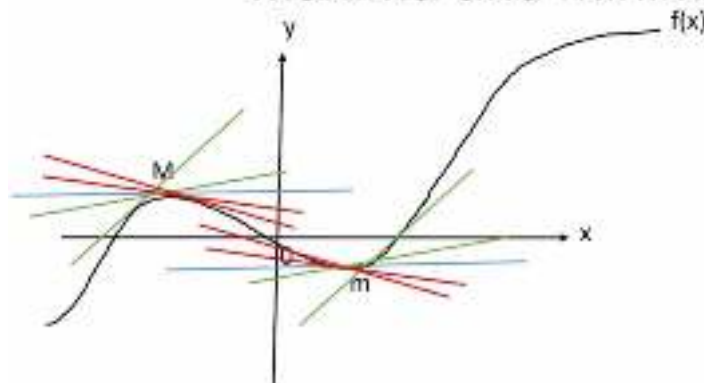

$$f''(x)=6x \rightarrow f''(x=0)=0$$

Inflection point  
neither Max nor min  
marks change of concavity

$f'(x)=0$  necessary but not sufficient condition  
for  $x$  to be either local Max or min of the function

Points where  $f''(x)=0$  are called **inflection points**  
In which the concavity of the function changes

## Maxima and minima of function $f(x)$

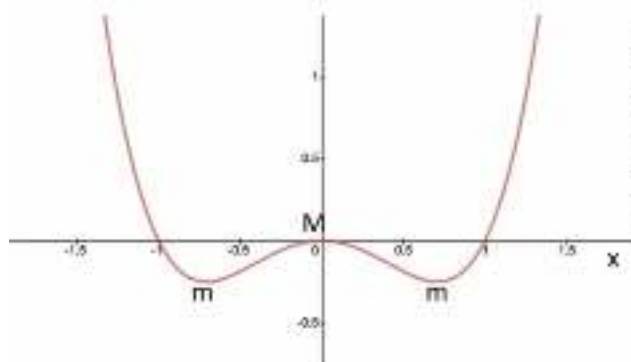

Close to M slope of tangent is positive  
first (green) then negative (red)  
→ the slope decreases

→  $f''(x) < 0$  in a Maximum

In m slope of tangent is negative first  
(red) then positive (green)  
→ the slope increases

→  $f''(x) > 0$  in a Minimum

# Maxima and minima of function $f(x)$

$$\begin{aligned}
 y &= f(x) = x^4 - x^2 \\
 f'(x) &= 4x^3 - 2x \\
 f'(x) &= 2x(2x^2 - 1) \rightarrow x=0; x=\pm 1/\sqrt{2} \\
 f''(x) &= 12x^2 - 2 \\
 f''(x=0) &= -2 < 0 \rightarrow \text{Maximum} \\
 f''(x=1/\sqrt{2}) &= f''(x=-1/\sqrt{2}) = 12/2 - 2 = 4 > 0 \\
 &\text{minima}
 \end{aligned}$$

$f(x) = \frac{x^2}{x+1}$

$\lim_{x \rightarrow +\infty} \frac{x^2}{x+1} \approx \frac{x^2}{x} = x$   
 $\lim_{x \rightarrow -\infty} \frac{x^2}{x+1} \approx \frac{x^2}{x} = x$

$x = -1$  v. asympt

$(x=0, y=0)$

$f'(x) = \frac{d}{dx} \left( \frac{x^2}{x+1} \right)$

$f(x) = \frac{h(x)}{g(x)} \rightarrow f'(x) = \frac{h'(x)g(x) - h(x)g'(x)}{(g(x))^2}$

$h(x) = x^2 \rightarrow h'(x) = 2x$   
 $g(x) = x+1 \rightarrow g'(x) = 1$

$f'(x) = \frac{2x \cdot (x+1) - x^2 \cdot 1}{(x+1)^2} = \frac{x^2 + 2x}{(x+1)^2} = 0?$

$x(x+2) = 0 \rightarrow \begin{cases} x=0 \\ x=-2 \end{cases}$

$\begin{matrix} \text{MAX?} \\ \text{MIN?} \\ \text{INFLECTION?} \end{matrix}$

$$f''(x) = \frac{d}{dx} \left( \frac{h(x)}{g(x)} \right) \quad \left( \frac{h(x)}{g(x)} \right)$$

$$h(x) = x(x+2) \rightarrow h'(x) = 2x + 2$$

$$g(x) = (x+1)^2$$

$$g(x) = p(q(x)) \rightarrow g'(x) = p'(q(x)) q'(x)$$

$$p(x) = x^2 \rightarrow 2x$$

$$q(x) = (x+1) \rightarrow 1$$

$$= 2(x+1) \cdot 1 = 2(x+1)$$

$$f''(x) = \frac{(2x+2)(x+1)^2 - x(x+2)2(x+1)}{(x+1)^4} = \begin{cases} f''(0) = 2 > 0 \\ x=0 \rightarrow \text{MIN} \\ f''(-2) = -2 < 0 \\ x=-2 \rightarrow \text{MAX} \end{cases}$$

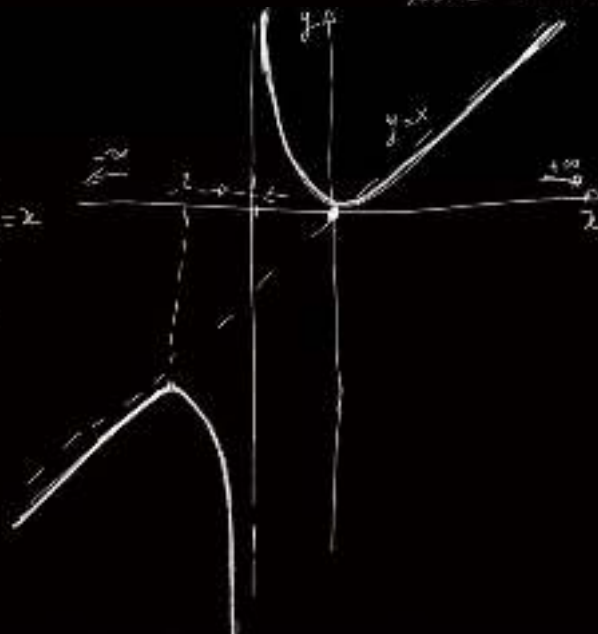

$$f(x) = \frac{x^2}{x+1}$$

$$\begin{cases} \lim_{x \rightarrow +\infty} \frac{x^2}{x+1} \approx \frac{x^2}{x} = x \\ \lim_{x \rightarrow -\infty} \frac{x^2}{x+1} \approx \frac{x^2}{x} = x \end{cases}$$

$$x = -1 \quad \text{v. asymp.}$$

$$(x=0, y=0)$$

## Summary

In this week, we learned about the properties of the derivative, L'Hopital's Rule, the relation of the minima/maxima of a function to its first and second derivative, and finally points of inflection.
