Cornell Notes	Topic: 16.1 Databases-Reading	Course: BSc Computer Science
		Class: How Computer Work [CM1030]-Reading
		Date: January 24, 2020
Essential Question:		
What is a database?		
Questions/Cues:		
<ul style="list-style-type: none">• What is a database?• What is a flat file?• What is a schema• What is a subschema?• What is a database management system?• What is database model?• What is a relational database?• What is lossless/Nonloss decomposition?• What are the Select, Project and Join Operations in a relational database?		
Notes		
<ul style="list-style-type: none">• Database = collection of data that is multidimensional, internal links between its entries make the info accessible from a variety of perspectives• Flat File = one-dimensional storage system, meaning that it presents its info from a single point of view		

Figure 9.1 A file versus a database organization

- Schema = description of the entire database structure that is used by the database software to maintain the database
- subschema = description of only that portion of the database pertinent to a particular user's need

Figure 9.2 The conceptual layers of a database implementation

- Database management system (DBMS) = the one that actually performs the manipulation of database, if user requests to add/delete info; it alters the database. If the users requests to retrieve info, it is the DBMS that is the one that performs the required searches
- Data independence = the ability to change the organization of the database itself without changing the app software
- Database model = conceptual view of the database
- Relational Database = collection of tables consisting of rows and columns, data stored in rectangular tables called relation, similar to spreadsheets
 - A row in a relation is called a tuple, and columns in a relation are referred to as attributes because each entry in a column describes some characteristic, or attribute of the entry rep'd by the corresponding tuple

Figure 9.3 A relation containing employee information

Empl Id	Name	Address	SSN
25X15	Joe E. Baker	33 Nowhere St.	111223333
34Y70	Cheryl H. Clark	563 Downtown Ave.	999009999
23Y34	G. Jerry Smith	1555 Circle Dr.	111005555

Figure 9.6 Finding the departments in which employee 23Y34 has worked

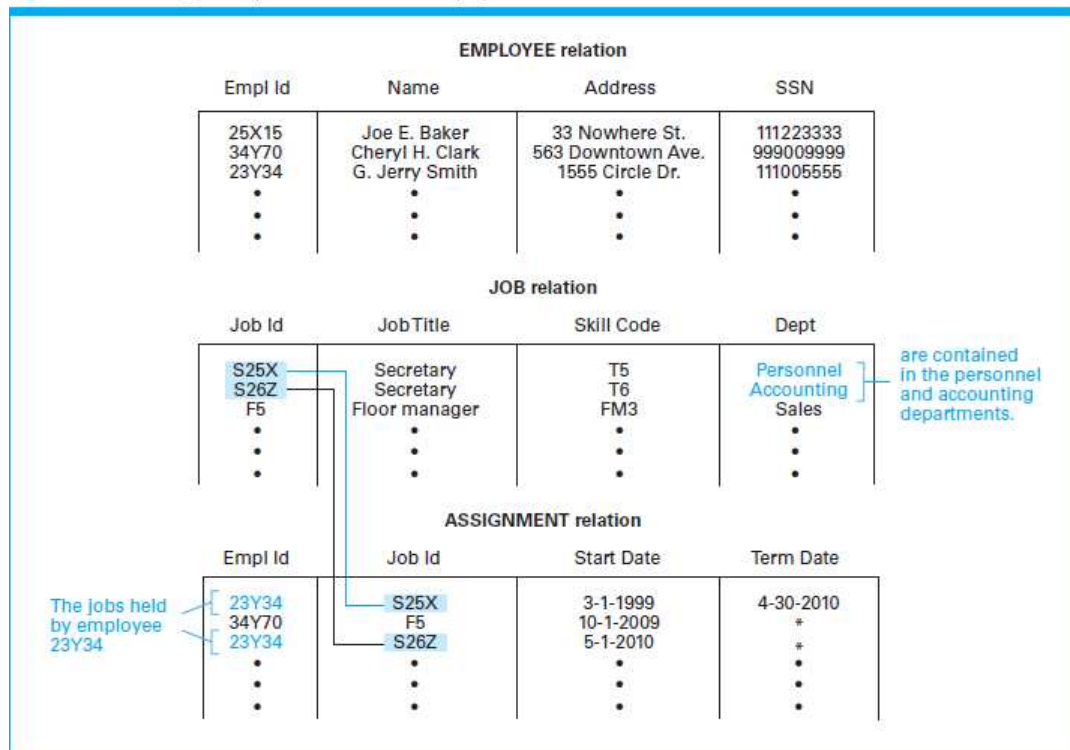

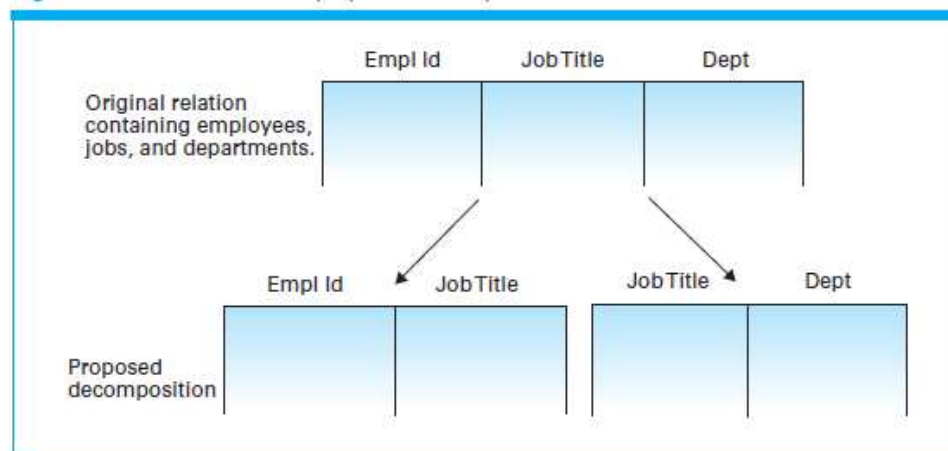

Figure 9.7 A relation and a proposed decomposition

- Lossless decomposition = loss of info when dividing a relation into smaller relation
- Nonloss decomposition = No loss of info when dividing a relation into smaller relations
- Select Operation = taking tuples possessing certain characteristics and to place these selected tuples in a new relation, extracting rows from a relation
- Project Operation = extracts columns from a relation
- Join Operation = used to combine different relations into one relation

Figure 9.8 The SELECT operation

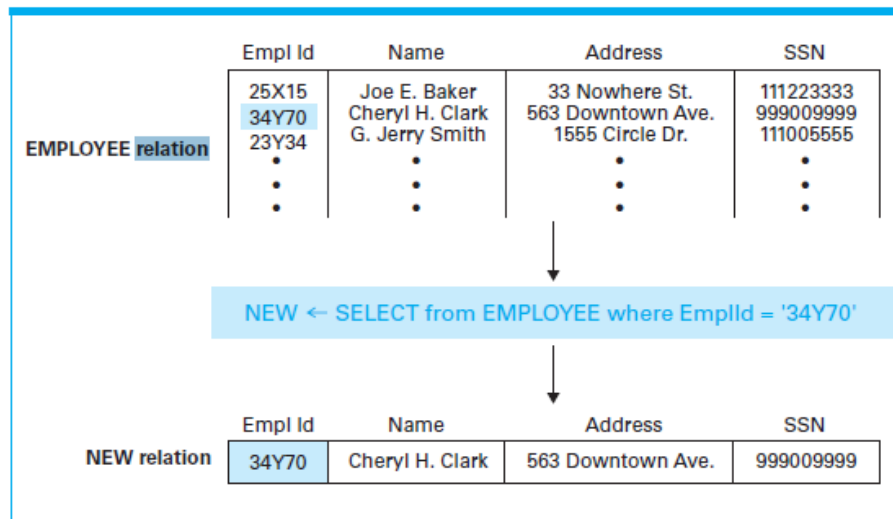

Figure 9.9 The PROJECT operation

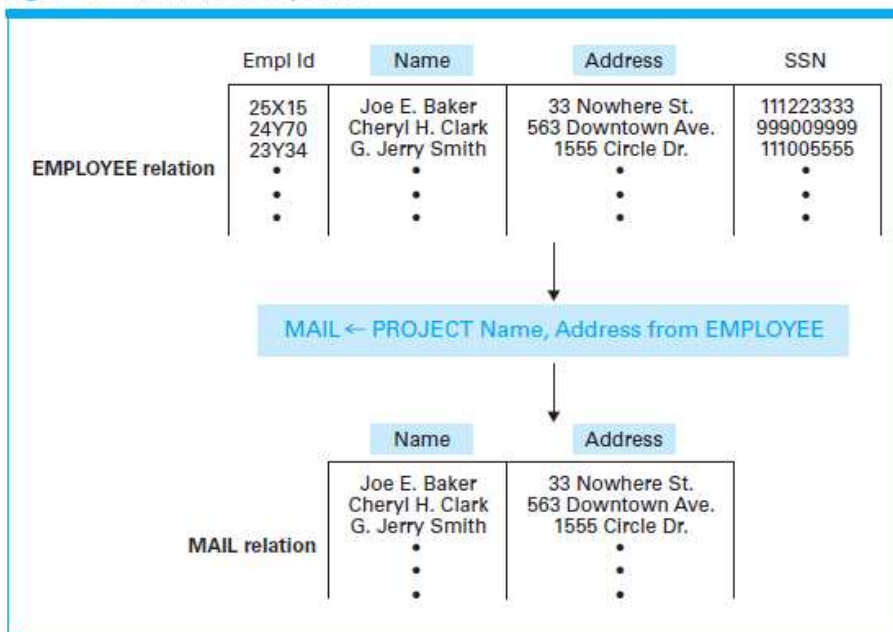

Figure 9.10 The JOIN operation

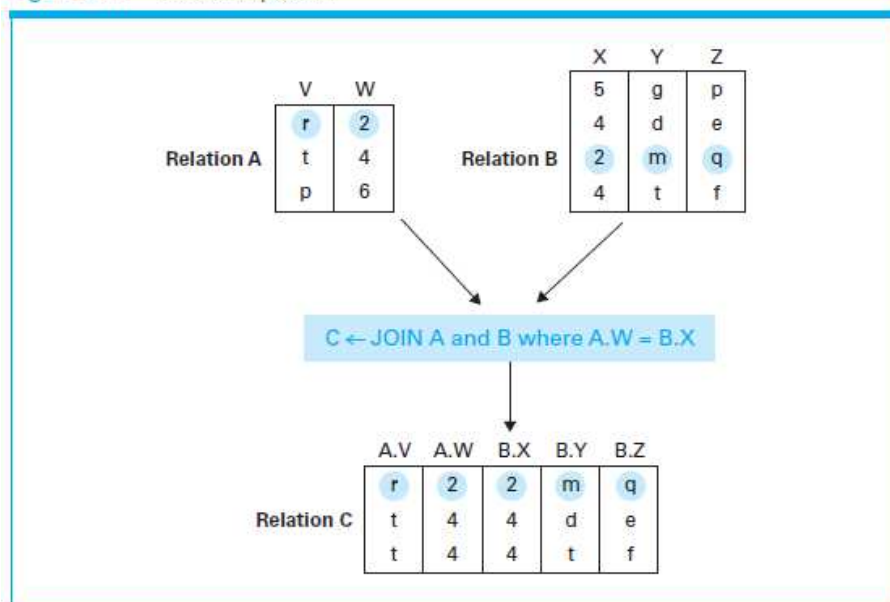

Figure 9.11 Another example of the JOIN operation

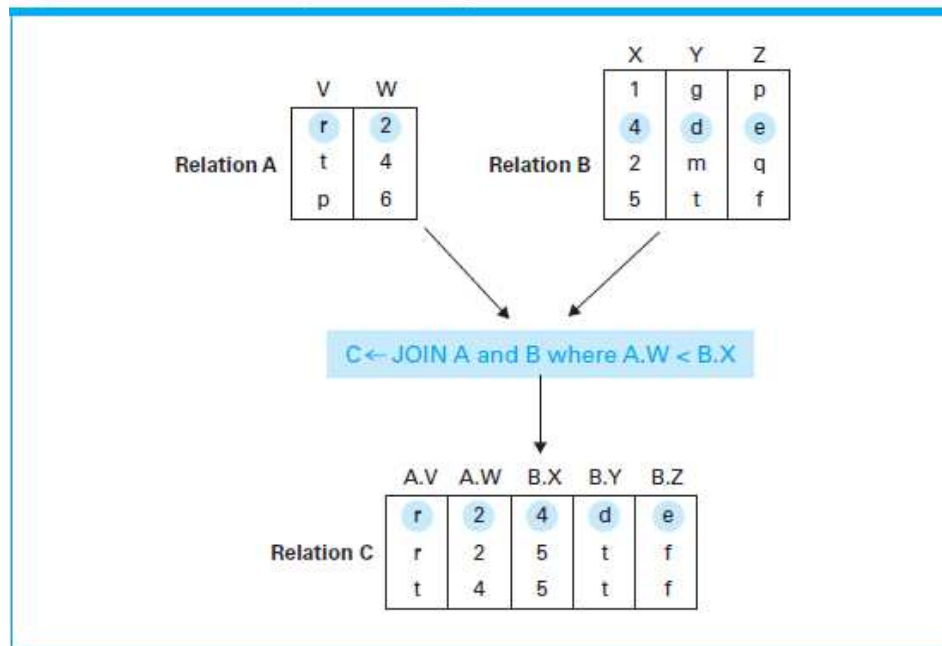

Figure 9.12 An application of the JOIN operation

Summary

In this week, we learned about what database is and the range of functions used to access data from a database.
